Linear Algebra for Computational Sciences and Engineering Ferrante Neri, 2019-07-26 This book presents the main concepts of linear algebra from the viewpoint of applied scientists such as computer scientists and engineers without compromising on mathematical rigor. Based on the idea that computational scientists and engineers need in both research and professional life an understanding of theoretical concepts of mathematics in order to be able to propose research advances and innovative solutions, every concept is thoroughly introduced and is accompanied by its informal interpretation. Furthermore, most of the theorems included are first rigorously proved and then shown in practice by a numerical example. When appropriate, topics are presented also by means of pseudocodes, thus highlighting the computer implementation of algebraic theory. It is structured to be accessible to everybody from students of pure mathematics who are approaching algebra for the first time to researchers and graduate students in applied sciences who need a theoretical manual of algebra to successfully perform their research. Most importantly, this book is designed to be ideal for both theoretical and practical minds and to offer to both alternative and complementary perspectives to study and understand linear algebra.

Topics in Computational Algebra G.M. Piacentini Cattaneo,Elisabetta Strickland,2012-12-06 The main purpose of these lectures is first to briefly survey the fundamental connection between the representation theory of the symmetric group S_n and the theory of symmetric functions and second to show how combinatorial methods that arise naturally in the theory of symmetric

functions lead to efficient algorithms to express various products of representations of S_n in terms of sums of irreducible representations. That is, there is a basic isometry which maps the center of the group algebra of S_n to the space of homogeneous symmetric functions of degree n . This basic isometry is known as the Frobenius map F . The Frobenius map allows us to reduce calculations involving characters of the symmetric group to calculations involving Schur functions. Now there is a very rich and beautiful theory of the combinatorics of symmetric functions that has been developed in recent years. The combinatorics of symmetric functions then leads to a number of very efficient algorithms for expanding various products of Schur functions into a sum of Schur functions. Such expansions of products of Schur functions correspond via the Frobenius map to decomposing various products of irreducible representations of S_n into their irreducible components. In addition, the Schur functions are also the characters of the irreducible polynomial representations of the general linear group over the complex numbers $GL_n(\mathbb{C})$.

Computer Algebra in Scientific Computing Vladimir P. Gerdt, Wolfram Koepf, Werner M. Seiler, Evgenii V. Vorozhtsov, 2014-09-01 This book constitutes the proceedings of the 16th International Workshop on Computer Algebra in Scientific Computing CASC 2014 held in Warsaw Poland in September 2014. Boulier, Matthew England, Timur M. Sadykov, Evgenii V. Vorozhtsov, 2022-08-10 This book constitutes the proceedings of the 24th International Workshop on Computer Algebra in Scientific Computing CASC 2022 which took place in Gebze Turkey in August 2022 The 20 full papers included in this book were carefully reviewed and selected from 32 submissions They focus on the theory of symbolic computation and its implementation in computer algebra systems as well as all other areas of scientific computing with regard to their benefit from or use of computer algebra methods and software A Course in Computational Algebraic Number Theory Henri Cohen, 2013-04-17 With the advent of powerful computing tools and numerous advances in mathematics computer science and cryptography algorithmic number theory has become an important subject in its own right Both external and internal pressures gave a powerful impetus to the development of more powerful algorithms These in turn led to a large number of spectacular breakthroughs To mention but a few the LLL algorithm which has a wide range of applications including real world applications to integer programming primality testing and factoring algorithms sub exponential class group and regulator algorithms etc Several books exist which treat parts of this subject It is essentially impossible for an author to keep up with the rapid pace of progress in all areas of this subject Each book emphasizes a different area corresponding to the author's tastes and interests The most famous but unfortunately the oldest is Knuth's Art of Computer Programming especially Chapter 4 The present book has two goals First to give a reasonably comprehensive introductory course in computational number theory In particular although we study some subjects in great detail others are only mentioned but with suitable pointers to the literature Hence we hope that this book can serve as a first course on the subject A natural sequel would be to study more specialized subjects in the existing literature **Symbolic Computation: Solving Equations in Algebra, Geometry, and Engineering** Edward L. Green, 2001 This volume presents the proceedings from the research conference Symbolic Computation Solving Equations in Algebra Analysis and Engineering held at Mount Holyoke College USA It provides an overview of contemporary research in symbolic computation as it applies to the solution of polynomial systems The conference brought together pure and applied mathematicians computer scientists and engineers who use symbolic computation to solve systems of equations or who develop the theoretical background and tools needed for this purpose Within this general framework the conference focused on several themes systems of polynomials systems of differential equations noncommutative systems and applications *EUROCAL '87* James H. Davenport, James Harold Davenport, 1989-08-09 This is the sixth in a series of conference proceedings of international conferences on computer algebra held in Europe All the preceding ones have also been published as Lecture Notes in Computer Science They contain original research material not published elsewhere and a few invited lectures summarising the state of the art Computer algebra is the science of using computers to do algebraic calculations rather than the purely arithmetic calculations which we all know computers can do These calculations may be polynomial like calculations one thread of the conference was devoted to polynomial algorithms or may relate to other areas

of mathematics such as integration the solution of differential equations or geometry a second thread was devoted to those topics The calculations can be applied in a wide range of scientific and engineering subjects and in branches of mathematics Physics has benefitted especially from these calculations and the proceedings contain many papers on this and also papers on applications in computer aided design and robotics to name but a few other applications The third thread of the proceedings was devoted to these applications and to the computer algebra systems which perform these calculations

Computational Commutative and Non-commutative Algebraic Geometry Svetlana Cojocaru, Gerhard Pfister, Victor Ufnarovski, 2005 Applications of Computational Algebraic Geometry David A. Cox, Dinesh N. Manocha, 1998 This book introduces readers to key ideas and applications of computational algebraic geometry Beginning with the discovery of Gröbner bases and fueled by the advent of modern computers and the rediscovery of resultants computational algebraic geometry has grown rapidly in importance The fact that crunching equations is now as easy as crunching numbers has had a profound impact in recent years At the same time the mathematics used in computational algebraic geometry is unusually elegant and accessible which makes the subject easy to learn and easy to apply This book begins with an introduction to Gröbner bases and resultants then discusses some of the more recent methods for solving systems of polynomial equations A sampler of possible applications follows including computer aided geometric design complex information systems integer programming and algebraic coding theory The lectures in this book assume no previous acquaintance with the material
