Fracture Behavior of Biological Materials and Interfaces Dhaneshwar Mishra ,2021-03-12 Fracture Behavior of Inhomogeneous Biological Materials and Interfaces Biological materials like bone nacre human tooth layers are inhomogeneous materials made up of soft collagen and hard hydroxyapatite HAP mineral arranged in such a fashion so that these materials have higher strength and toughness the measure of crack resisting behavior in materials at the same time which is exclusive in nature for different class of materials available for different application areas The interfaces in these biological materials are designed in such a fashion so that the load transfer between the constituents takes place so smoothly therefore become a region of strength not susceptible to failure like in other man made materials and composites It is important to understand these aspects of biological materials so that they can be mimicked to the novel materials to satisfy the growing need of different industries

Structural Failure and Plasticity X.L. Zhao,R.H. Grzebieta,2000-10-04 As mankind continues to push back the boundaries and begins to explore other worlds and the ocean depths a thorough understanding of how structures behave when subjected to extremes in temperature pressure and high loading rates will be essential This symposium provided the perfect forum for presenting research into structures subjected to such extreme loads There were a large number of papers presented under topics of impact blast and shock loading indicating a strong research interest in high rates of loading Similarly new topics have been added to the traditional symposium list such as fire loading earthquake loading and fatigue and connection failures It is clear now that fundamental knowledge of plastic deformation of structures to various extreme loads is coming of age Each full paper was peer reviewed by at least two experts in the field
