

# ABGD Study Guide

The protocol for dental trauma involves all of the following, except

- a. Ideally, the tooth should be repositioned to its original position.
- b. EPT and thermal testing are unreliable following trauma since physical trauma can severe or damage nerve supply without altering pulpal blood supply/vitality.
- c. If the root is completely formed on a tooth that has been intruded, a pulpectomy should be performed within 1-3 weeks after the injury.
- d. The tooth should be splinted for 2 to 4 months if it sustains a root fracture - correct answer ✓d. The tooth should be splinted for 2 to 4 months if it sustains a root fracture

When evaluating horizontal root fractures, one should consider all as being true, except:

- A. Chances of coronal root fractures healing are similar to mid-root or apical fractures if the fracture is below the height of crestal bone and properly splinted
- B. If the fracture is at or coronal to the crest of the alveolar bone, the prognosis is still favorable
- C. Pulpal necrosis occurs in 25% of root fractures
- D. In the vast majority of cases, necrosis occurs in the coronal segment only with the apical segment remaining vital - correct answer ✓B. If the fracture is at or coronal to the crest of the alveolar bone, the prognosis is still favorable

How long should horizontal root fractures be splinted if the coronal section was displaced and repositioned?
